TaliaUndo
Backup & Restore

In accordance with today's backup and data protection requirements, which differ from traditional backup tools with their security features;

- Place the backup on inaccessible media
- Restoring to non-deletable media

It is a secure backup solution.

Why TaliaUndo?

Data kept on storage units or backups taken to these units are managed from the local network and are open to access attempts and attacks, even if secure access methods are used.

Access and authorization stages such as Login Information, 2FA, OTP, etc. may be vulnerable to malicious actions in attempts and attacks.

However, these environments, which are accessible from the local network, can be rendered dysfunctional with advanced attack methods, even if they cannot be accessed.

TaliaUndo performs backup management operations in a controlled manner with its secure management console. TaliaUndo's network-accessible interface only displays reports of defined backup jobs and backups taken.

Thus, it does not provide an area for access and attack attempts.

Network inaccessibility

TaliaUndo only allows access from the selected network or PC.

Data Management

TaliaUndo runs the defined backup process every day and synchronizes it in the inaccessible directory.

The backup taken; It stores Daily, Weekly, Monthly and Yearly.

Backups taken cannot be deleted even with administrator authority.

TaliaUndo operates the backup mechanism itself and keeps the backups in the loop and updates them accordingly.

Restored Backup Cannot Be Changed/Deleted

TaliaUndo restores from backup by copying the backup to its own temp area and makes it accessible temporarily. (Original backup data is not used) Data (immutable) that is temporarily accessible cannot be changed or deleted.

Backup & Restore
